cleaning
easier and
safer!**

The AquaQlean® System!

Cleaning glass and façade cladding has been a specialised area within professional cleaning services for years. Aspects such as **safety, cost** and **accessibility** are of essential importance. However, this combination of aspects can lead to problematic situations.

Architects often design striking buildings in the most contemporary building styles. But this very architecture also means that glass and facades can be extremely difficult to access for cleaning and maintenance. The ideal solution for this kind of problem can be found in the clever **AquaQlean® System**. AquaQlean® offers optimal accessibility and a perfectly clean result through the use of light, stable and durable tubing.

Situations where glass and facades can be virtually impossible to reach include **roofing over shopping promenades**, domed roofing or situations where **fountains or gardens** form obstacles, etc.

BASED**

Problem areas highlighted by both the professional cleaning branch and technical services (real estate market) relating to the aspects mentioned above have resulted in the development of a system that offers safer and more productive levels of glass and facade cleaning in most situations.

Cleaning will be done with the use of mineral free water for maximum cleanliness and (after drying) a perfectly transparent result with no visible streaks.

The most important advantages of the AquaQlean® System are:

- Dries without leaving streaks and marks in all weather conditions, even in direct sunlight
- Stays cleaner for longer - the mineral free water protects the surface from soiling. Reduces the effect of static electricity to a minimum.
- Suitable for cleaning glass, window frames, illuminated signs and lights, wall cladding, awnings etc.
- Optimal accessibility and rapid application
- Safe working conditions
- Light and robust aluminium or carbonfibre tubing

How does AquaQlean® work and what is purified water?

We know water as H₂O. Each water molecule consists of one atom of oxygen and two atoms of hydrogen. These atoms form two charged ions in water.

A hydrogen atom is a positively charged hydrogen ion (acid); the other is compounded to the oxygen atom to form a negatively charged hydroxide ion (alkaline). Purified water therefore acts as a remarkable solvent, thanks to the ability of these charged ions to form compounds with other ions in the same way.

In other words: the positive and negative charges attract each other. This property of purified water is exploited in the **AquaQlean® system**. When purified water flows over a surface it dissolves all the substances it comes into contact with and leaves a clean, streak free surface behind. To achieve this effect, correct cleaning methods and sufficient rinsing time must be taken into account.

For a detailed information package with full technical data about AquaQlean® please contact your dealer...

- **Streak free results**
- **Tubing: Stable, durable, robust and light**
- **To clean glass, window frames, illuminated signs and lights, wall cladding, awnings etc.**
